European Models
Audi A3/S3
Audi TT
VW Bora 4motion
VW Bora Variant 4motion
VW Golf 4motion
VW Golf Variant 4motion
VW Golf GTI R32

These bars are made of high strength alloy steel and can be adjusted up to 2" in length by loosening the jam nuts at either end and rotating the main bar using the center hex nut. The inboard end of the bar features a stainless Heim joint with a zirc fitting such that it can be greased. Stainless bushings are also utilized on the inboard end to prevent any lateral movement of the bar once installed. These bars will allow owners of these models to successfully lower the rear suspension while being able to adjust both camber and caster (upper and lower adjustable bars are required for caster adjustment). Please ensure that only qualified trained technicians install these bars and align the rear wheels after installation. It is advisable to use lock-tite on the jam nuts once the proper adjustments have been made to prevent the nuts from backing off.
